DocuRAG Sample Document

What is document retrieval?

Document retrieval is the process of finding useful information in a collection of files.
A document question-answering system first extracts text from documents.
It then divides long text into smaller passages that can be searched efficiently.

Why are page numbers useful?

Page numbers help readers locate the original evidence behind an answer.
A helpful system can show both a short answer and the source page.

A simple processing workflow

PDF file -> extracted text -> searchable passages -> answer with a source
